

Package overview:

- Inside `catkin_ws/src`, the main package is `scara_robot`. It does not directly contain any nodes or launch files, but is a way to organize all of the other nodes.
 - New package:
 - * The `scara_pd_controller` package implements a proportional and derivative controller for joint 5 (prismatic joint (d_3)). The controller functions by reading the current joint position using the `gazebo/get_joint_properties` service, calculating the necessary input into the joint, and applying the input force using the `gazebo/apply_joint_effort` service. The controller receives the desired reference position using a custom service message under `scara/JointControlReference`.
 - Old packages used (from PA #1):
 - * The `scara_gazebo` package includes the launch files for the gazebo world.
 - * The `scara_description` package includes the URDF files for the robot as well as the rviz launch files.

1. Fix all of the joints except the last joint (joint 5) by changing the joint type field of the corresponding joints to "fixed" in the robot description file.

The following changes were made to the XACRO file:

- a. Change joint 1 and joint 3 to 'Fixed' joints (joints 2 and 4 are already set to type 'Fixed')

```

1 <joint name="joint1" type="fixed">
2 <parent link="link1"/>
3 <child link="link2"/>
4 <origin xyz="0 0 ${height1 - axel_offset}" rpy="0 0 1.570796"/>
5 </joint>
6 ...
7 <joint name="joint3" type="fixed">
8 <parent link="link3"/>
9 <child link="link4"/>
10 <origin xyz="0 1.5 2.5" rpy="1.57 0 0"/>
11 </joint>

```

- b. Remove all collision/inertial properties from links 1-4, (found to cause physics issues in simulation) (Example shown for link 3)

```

1 <link name="link3">
2 (-) <collision>
3 (-) <origin xyz="0 0 1.25" rpy="0 0 0"/>
4 (-) <geometry>
5 (-) <box size="${width} ${width} 2.5"/>
6 (-) </geometry>
7 (-) </collision>
8 <visual>
9 <origin xyz="0 0 1.25" rpy="0 0 0"/>
10 <geometry>
11 <box size="${width} ${width} 2.5"/>
12 </geometry>
13 <material name="orange"/>
14 </visual>
15 (-) <inertial>
16 (-) <origin xyz="0 0 1.25" rpy="0 0 0"/>
17 (-) <mass value="${mass}"/>
18 (-) <inertia
19 (-) ixx="${mass / 12.0 * (width*width + height3*height3)}" ixy="0.0" ixz
    = "0.0"

```

```

20 (-)          iyy="{mass / 12.0 * (height3*height3 + width*width)}" iyz="0.0"
21 (-)          izz="{mass / 12.0 * (width*width + width*width)}"/>
22 (-)    </inertial>
23 </link>
24
25 (+) <joint name="joint3" type="fixed">
26 (-) <joint name="joint3" type="revolute">
27 <parent link="link3"/>
28 <child link="link4"/>
29 <origin xyz="0 1.5 2.5" rpy="1.57 0 0"/>
30 (-)    <axis xyz="0 0 1"/>
31 (-)    <limit effort="100" lower="-1.57" upper="1.57" velocity="1"/>
32 (-)    <dynamics damping="0.7"/>
33 </joint>

```

c. Remove all <transmission> instances from URDF file

```

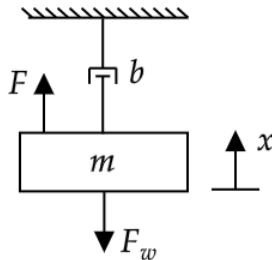

1 (-) <transmission name="tran1">
2 (-)   <type>transmission_interface/SimpleTransmission</type>
3 (-)   <joint name="joint1">
4 (-)     <hardwareInterface>hardware_interface/EffortJointInterface </
   hardwareInterface>
5 (-)   </joint>
6 (-)   <actuator name="motor1">
7 (-)     <hardwareInterface>hardware_interface/EffortJointInterface </
   hardwareInterface>
8 (-)     <mechanicalReduction>1</mechanicalReduction>
9 (-)   </actuator>
10 (-) </transmission>
11 (-)
12 (-) <transmission name="tran2">
13 (-)   <type>transmission_interface/SimpleTransmission</type>
14 (-)   <joint name="joint3">
15 (-)     <hardwareInterface>hardware_interface/EffortJointInterface </
   hardwareInterface>
16 (-)   </joint>
17 (-)   <actuator name="motor2">
18 (-)     <hardwareInterface>hardware_interface/EffortJointInterface </
   hardwareInterface>
19 (-)     <mechanicalReduction>1</mechanicalReduction>
20 (-)   </actuator>
21 (-) </transmission>
22 (-)
23 (-) <transmission name="tran3">
24 (-)   <type>transmission_interface/SimpleTransmission</type>
25 (-)   <joint name="joint5">
26 (-)     <hardwareInterface>hardware_interface/EffortJointInterface </
   hardwareInterface>
27 (-)   </joint>
28 (-)   <actuator name="motor3">
29 (-)     <hardwareInterface>hardware_interface/EffortJointInterface </
   hardwareInterface>
30 (-)     <mechanicalReduction>1</mechanicalReduction>
31 (-)   </actuator>
32 (-) </transmission>

```

2. Write a position controller node.

- Get positions from Gazebo and be able to send joint efforts.
- Design PD controller (tune gains, don't calculate)
- Implement service that takes in a reference (desired) position for the last joint.
- Record both the reference position and current position in a text file. Plot the comparison in MATLAB.

The E.O.M. of our third link for our controller is below:

$$\sum F = ma \Rightarrow F - b\dot{x} - F_w = m\ddot{x}$$

$$m\ddot{x} + b\dot{x} + F_w = F$$

$$H(s) = \frac{X(s)}{F(s)} = \frac{1}{ms^2 + bs + F_w}$$

Our controller (PD) will have the following form:

$$C(s) = k_p + k_d s \Rightarrow c(t) = k_p E + k_d \frac{dE}{dt}$$

where $E = d_{3,\text{desired}} - d_{3,\text{current}}$ and dt is the time step of the controller loop. k_p and k_d are the gains for the proportional and derivative terms, respectively.

The main file for the controller exists in the `scara_pd_controller` package under the `pd_control.py` file.

The control values are calculated within the `pd_control` function:

```

1 def pd_control(joint, pos_cur, pos_des, kp, kd):
2     global E_old
3
4     E = pos_des - pos_cur
5     d_err = (E - E_old) / (1 / rate)
6     f = -(kp * E + kd * d_err)
7
8     if debug == True:
9         print("\nerr = %f, d_err = %f" % (E, d_err))
10        print("\npos_des = %f, pos_cur = %f" % (pos_des, pos_cur))
11        print("\nSending joint force f = [%f]" % (f)) # printing
12        print("calculated values to terminal")
13
14        je_service = rospy.ServiceProxy('/gazebo/apply_joint_effort',
15        ApplyJointEffort)
16        zero_time = rospy.Time()
17        tick = rospy.Duration(0, int((1 / rate) * 10 * 9))
18        je_service(joint, f, zero_time, tick)
19
20        if print_to_file == True:
21            file1.write("%f,%f,%f,%f\n" % (pos_cur, pos_des, f, 1 / rate))
22
23        E_old = E
24
25        return f

```

The joint positions are obtained in the following function:

```

1 def request_joint_status(joint):
2     global d3
3     global d3_old
4
5     joint_stauts = rospy.ServiceProxy('/gazebo/get_joint_properties',
6         GetJointProperties)
7     resp = joint_stauts(joint)
8
9     d3 = -resp.position[0]
10
11     if debug == True:
12         print("\n\nReceived joint position: [%f] (d3) (meters)" % (d3))
13         # printing received data to terminal
14
15     pd_control('joint5', d3, d3_des, kp, kd)
16
17     return resp

```

The reference position is set with the following function

```

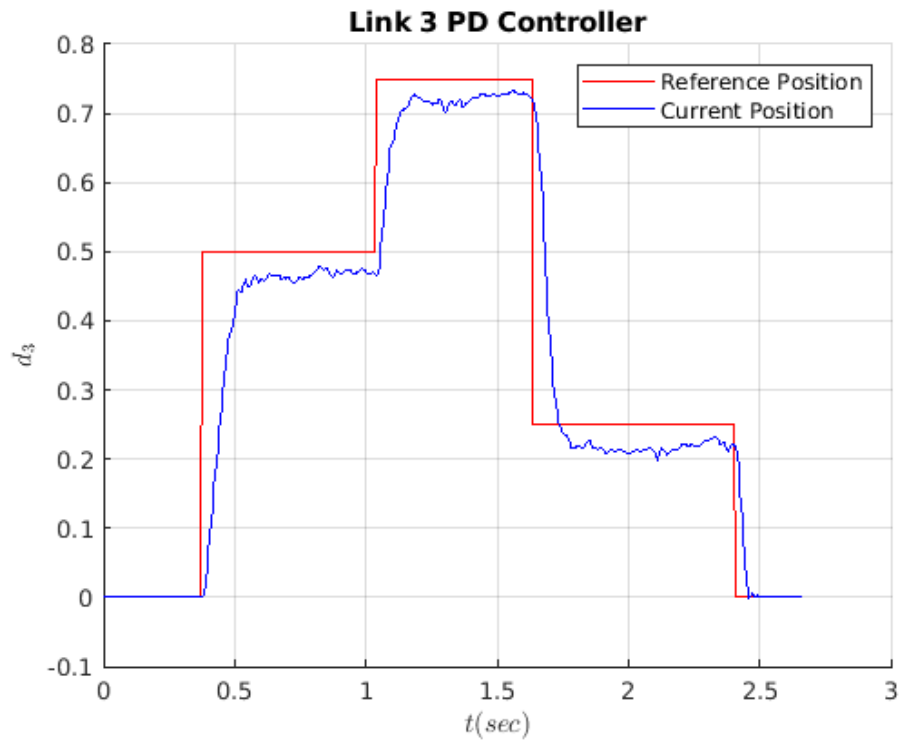

1 def service_handle(data):
2     global d3_des
3
4     d3_des = data.d3_des
5
6     if debug == True:
7         print("\n\nReceived reference position d3 = %f]" % (d3_des)) #
8         # printing converted values to terminal
9
10    if d3_des >= 0 or d3_des <=1:
11        success = True
12    else:
13        success = False
14
15    return success

```

Steps to run:

- (a) `catkin_make`
- (b) `source devel/setup.bash`
- (c) `roslaunch scara_gazebo scara_world.launch`
- (d) In a new window, `roslaunch scara_pd_controller pd_control.py`. The controller will begin controlling the joint to its home position ($d_3 = 0$).
- (e) In a new window, `rosservice call /scara/JointControlReference "d3_des: X.XX"` where X.XX is any number between 0 and 1 (joint limits).

The results from MATLAB are shown below from setting the reference position to 0.5, 0.75, then 0.25:

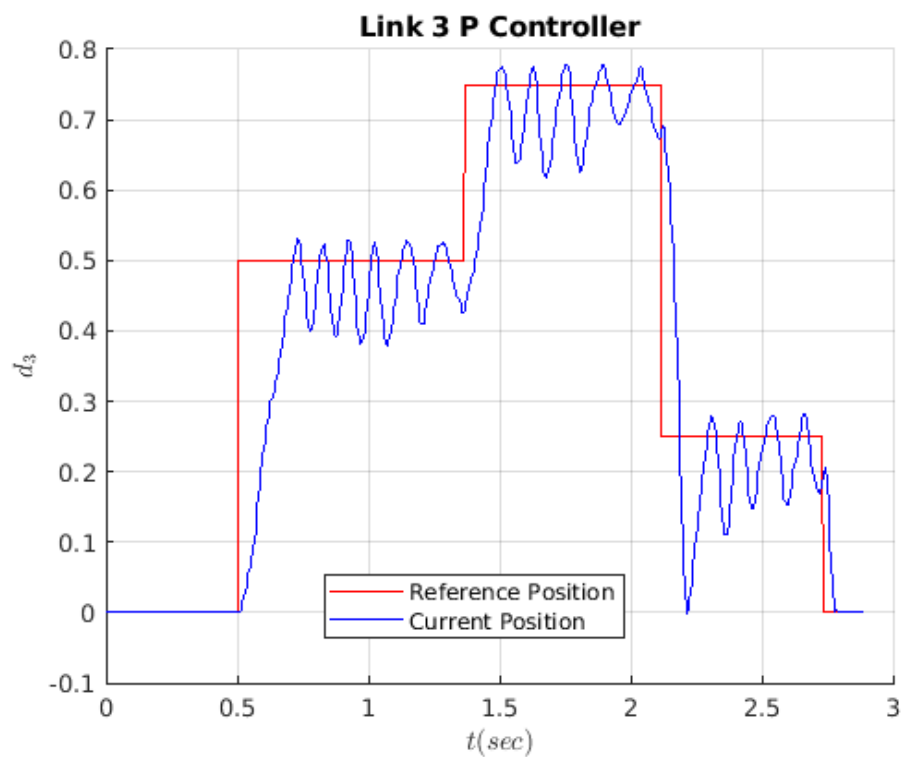

From the PD plot, we can see that the position of the link is approaching the reference position with limited overshoot (due to the tuning of the derivative term). There is a slight steady-state error due to the absence of an integral term. The addition of an integral term would accumulate that steady-state error and bring the current link position closer to the reference.

The resulting gains are below:

$$k_p = 1100 \quad k_d = 35$$

These gains were determined experimentally by observing the overshoot and reaction of the link.

To show the effect of having the derivative term in our controller, we can also show the link's response with a proportional only controller ($k_d = 0$):

It is apparent that there is a large amount of oscillations about the reference positions. The derivative term helps dampen this greatly.
